Java Servlets - Introduction

Presented by

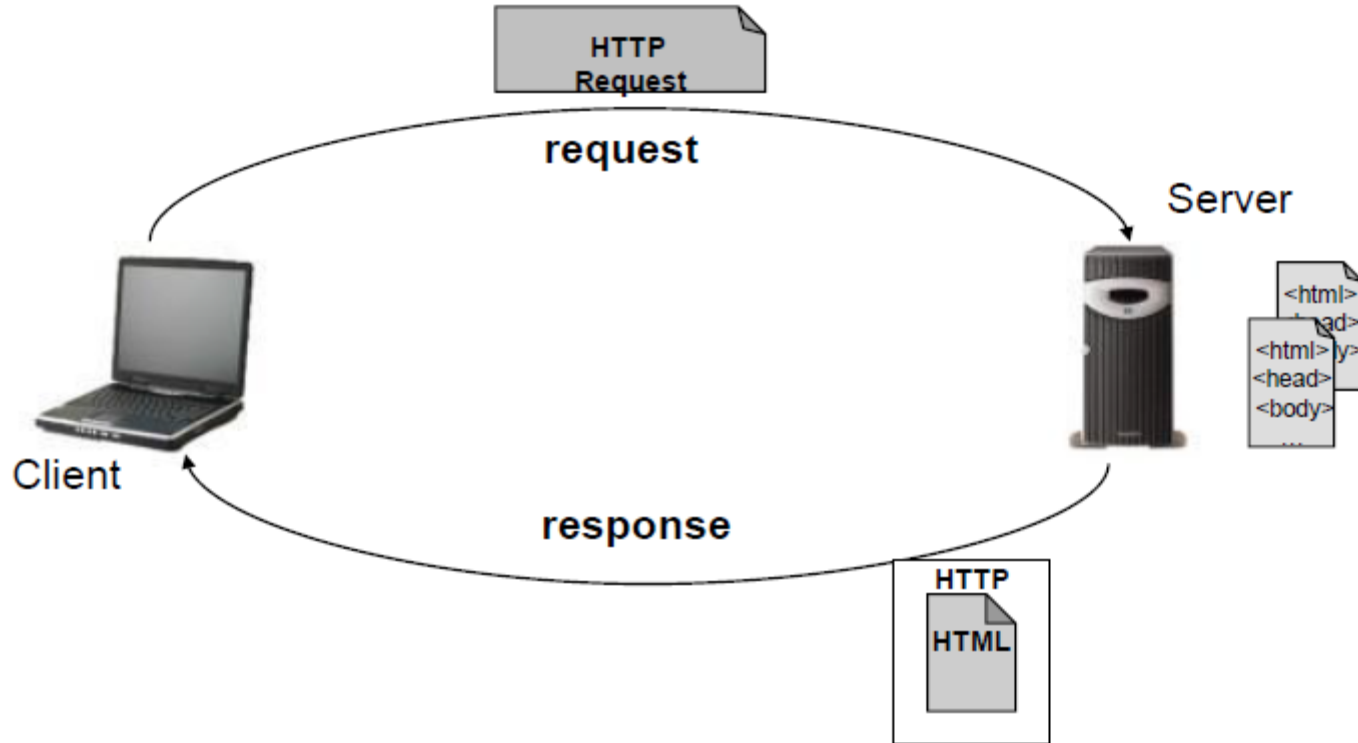

MVC Design Pattern

Request and Response

Request-response model.

HTTP Request and Response

HTTP Request

Key elements of a “request” stream:

- HTTP method (action to be performed).
- The page to access (a URL).
- Form parameters.

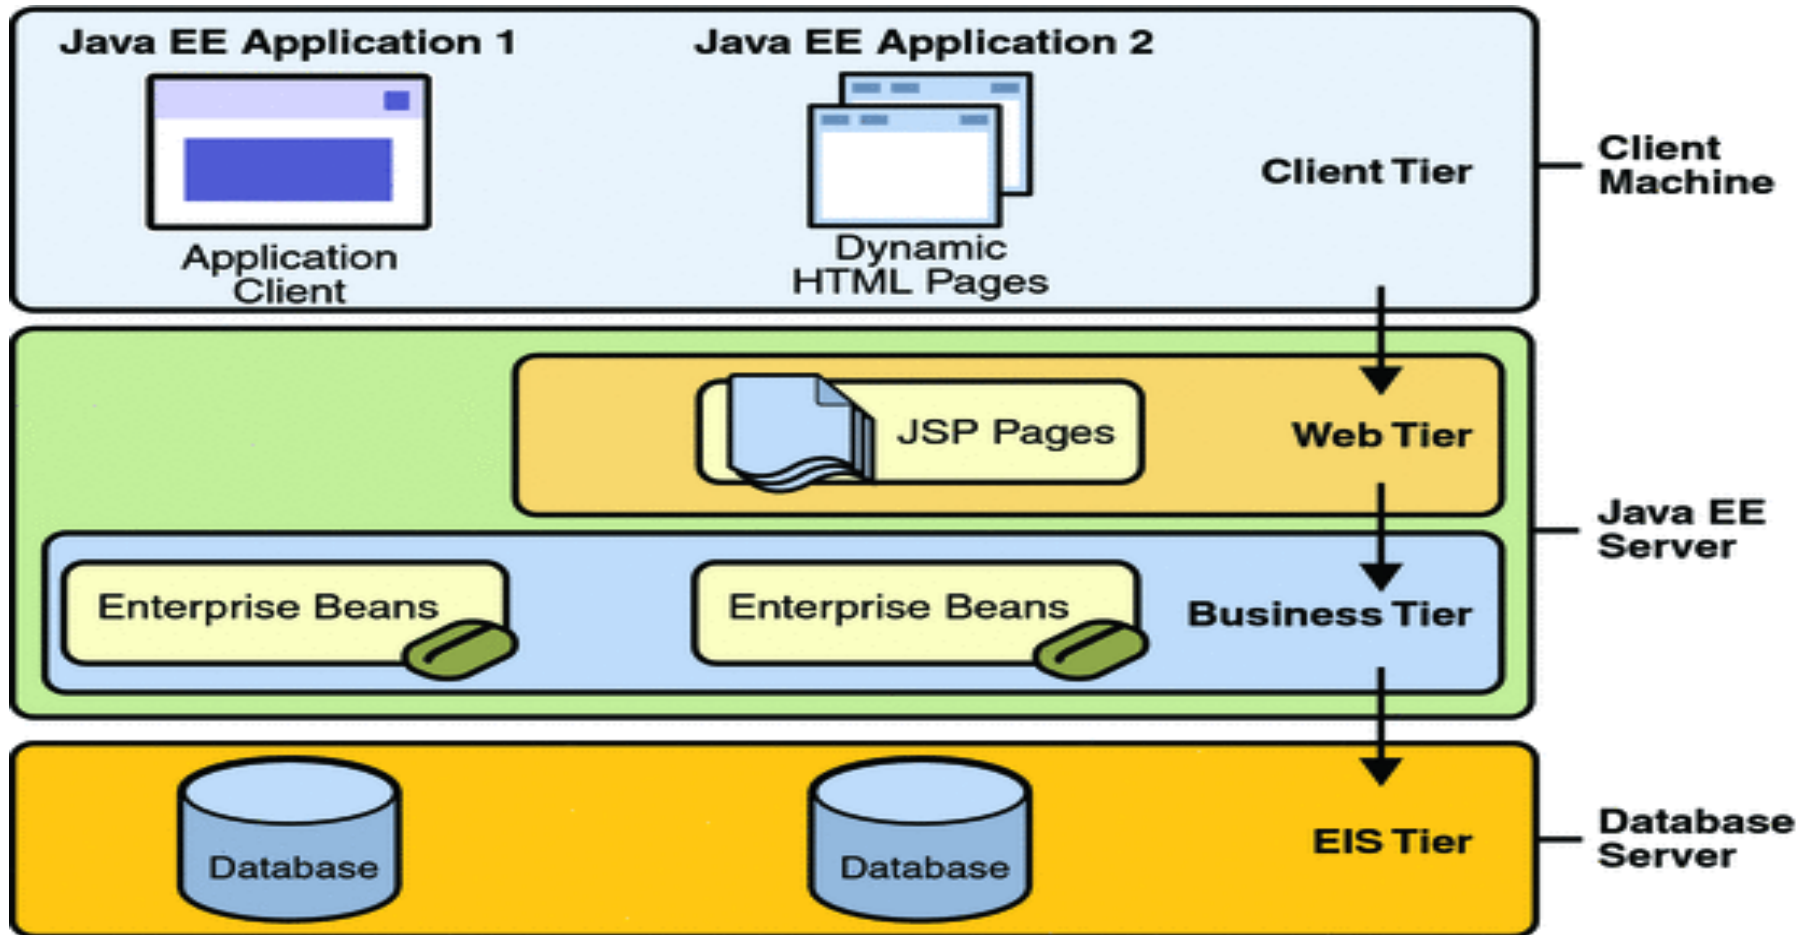

HTTP Response

Key elements of a “response” stream:

- A status code (for whether the request was successful).
- Content-type (text, picture, html, etc...).
- The content (the actual content).

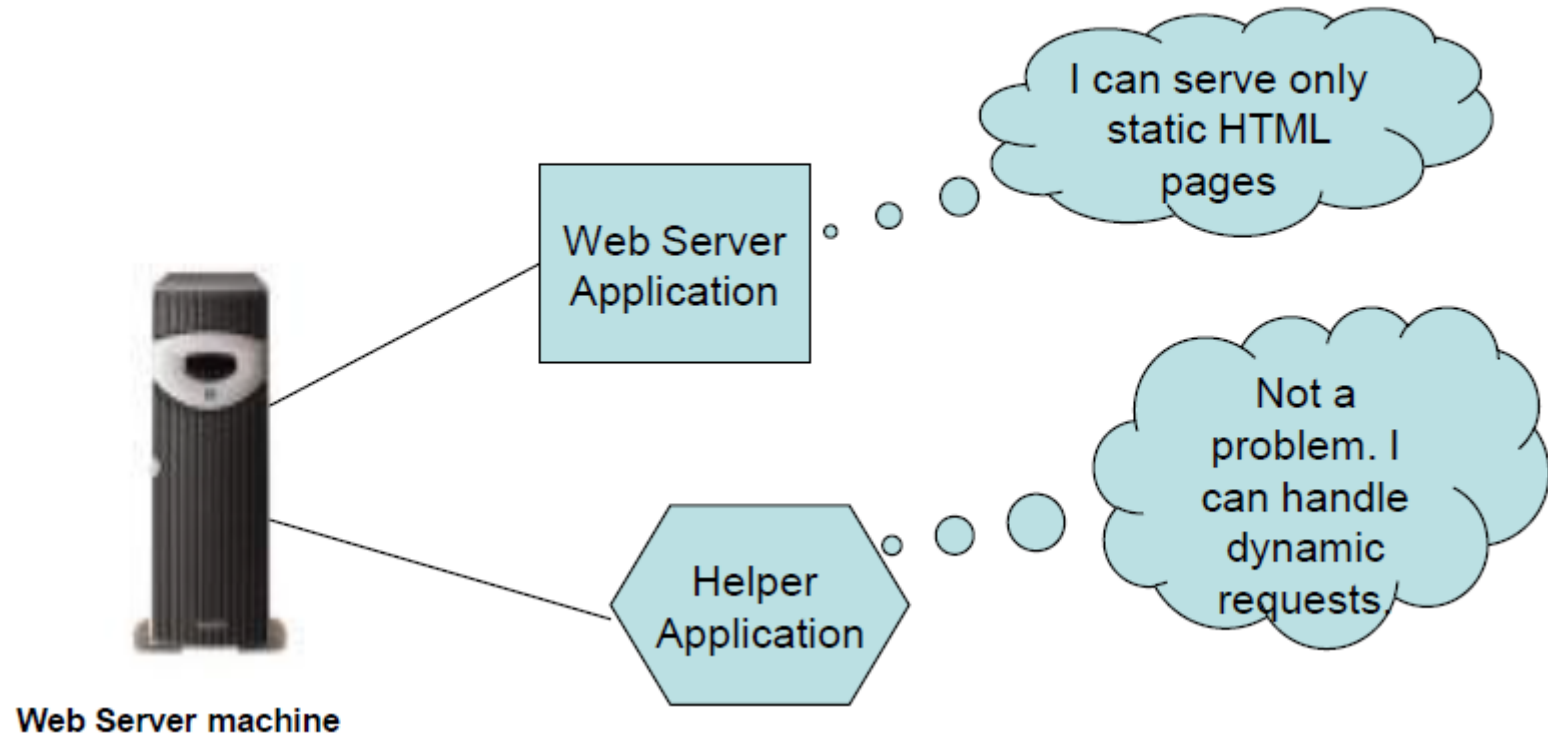

Java Enterprise Edition Architecture

Servlet – What ?

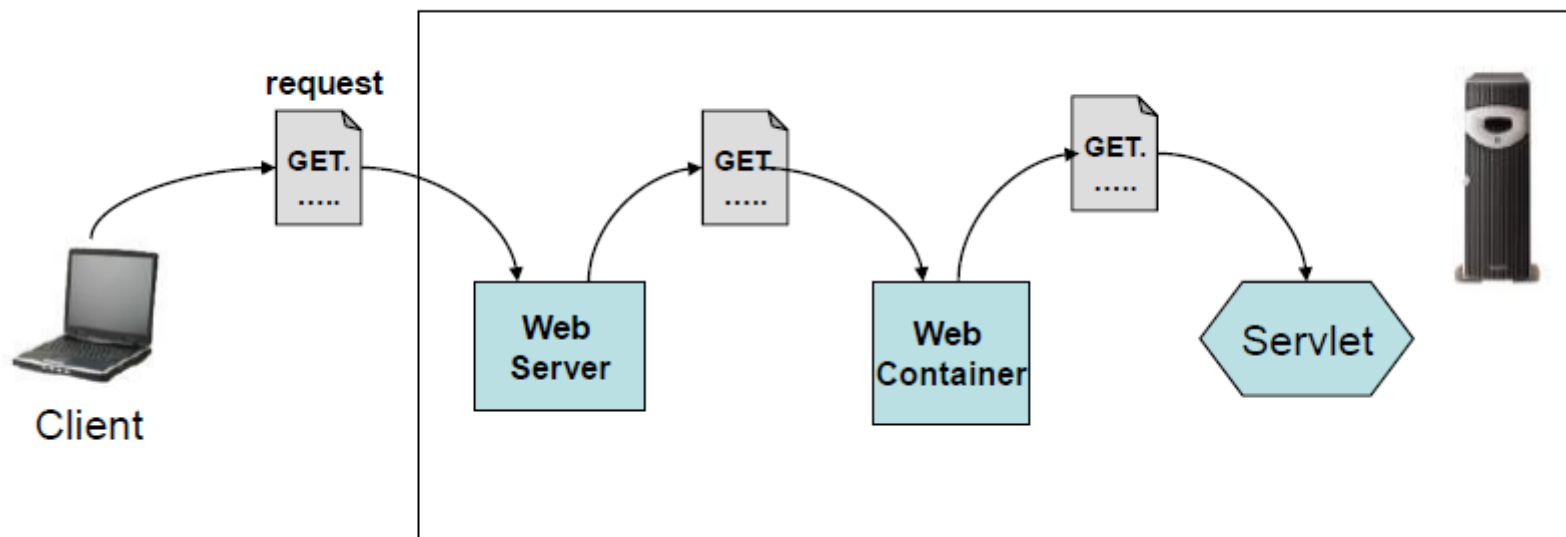

Where does Servlet come into the picture?

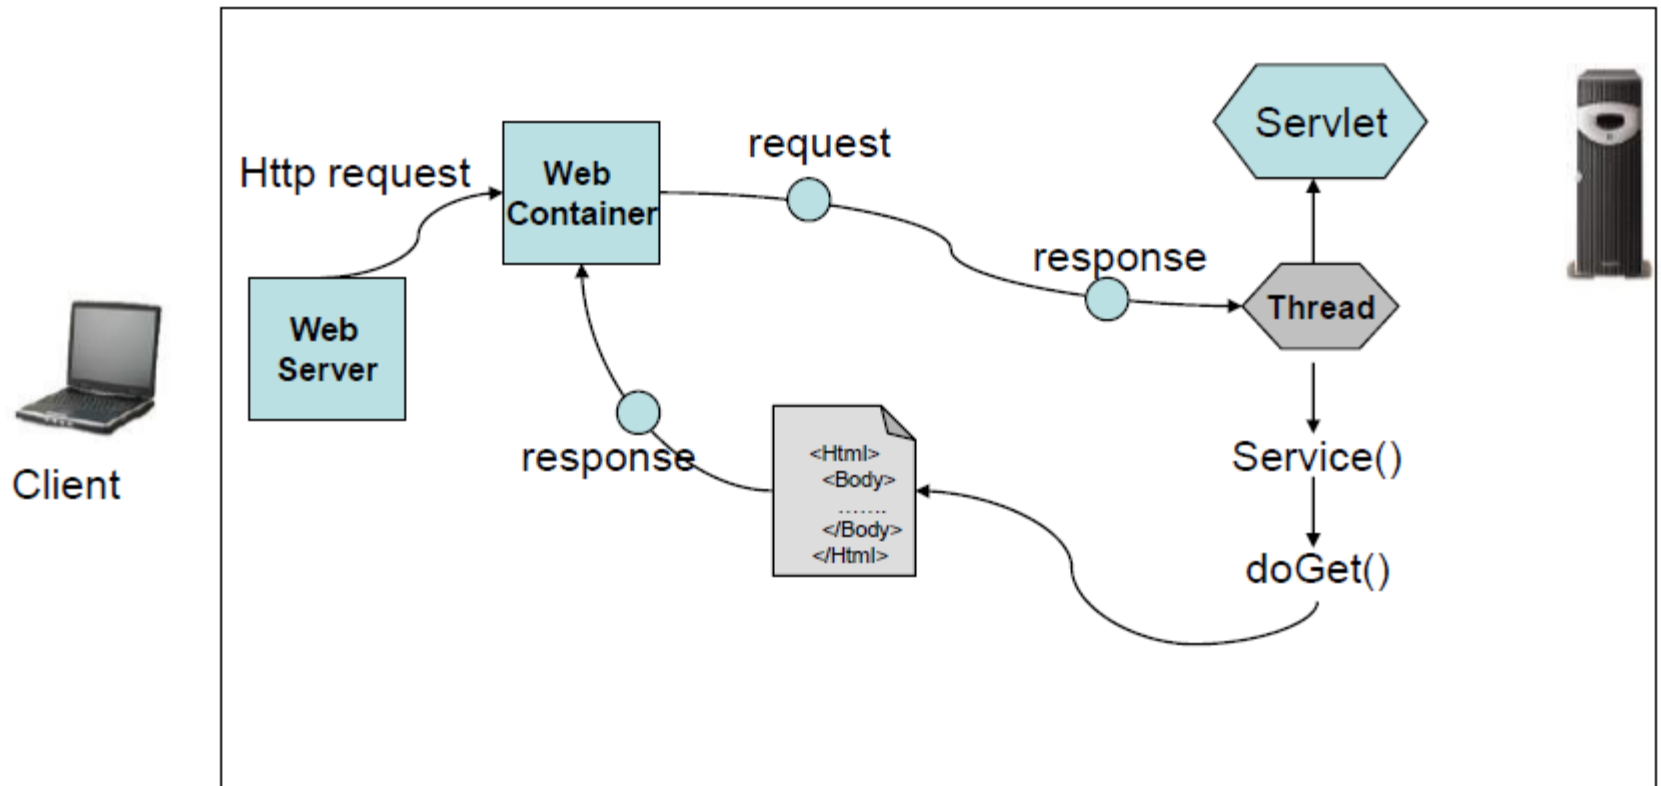

“The Helper Application is a **SERVLET**”

Web Container

Container Handling a Request

Role of a Web Container

- Communication Support
- Lifecycle Management
- Multi-threading support
- Security
- JSP Support

The container can contain multiple Servlets & JSPs within it

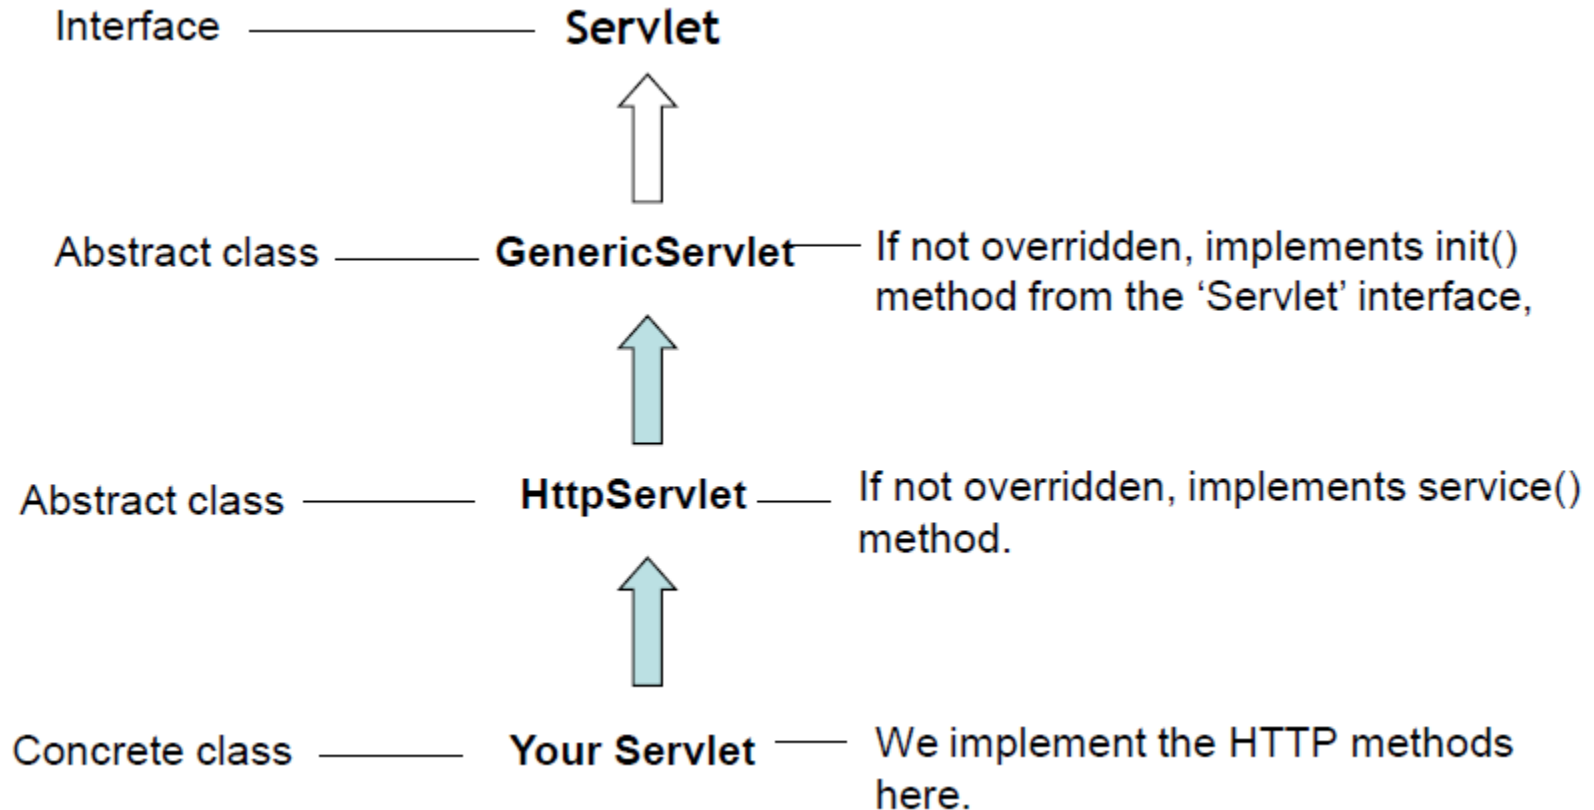

Servlet Life Cycle

The Servlet lifecycle is simple, there is only one main state - "Initialized".

Servlet Hierarchy

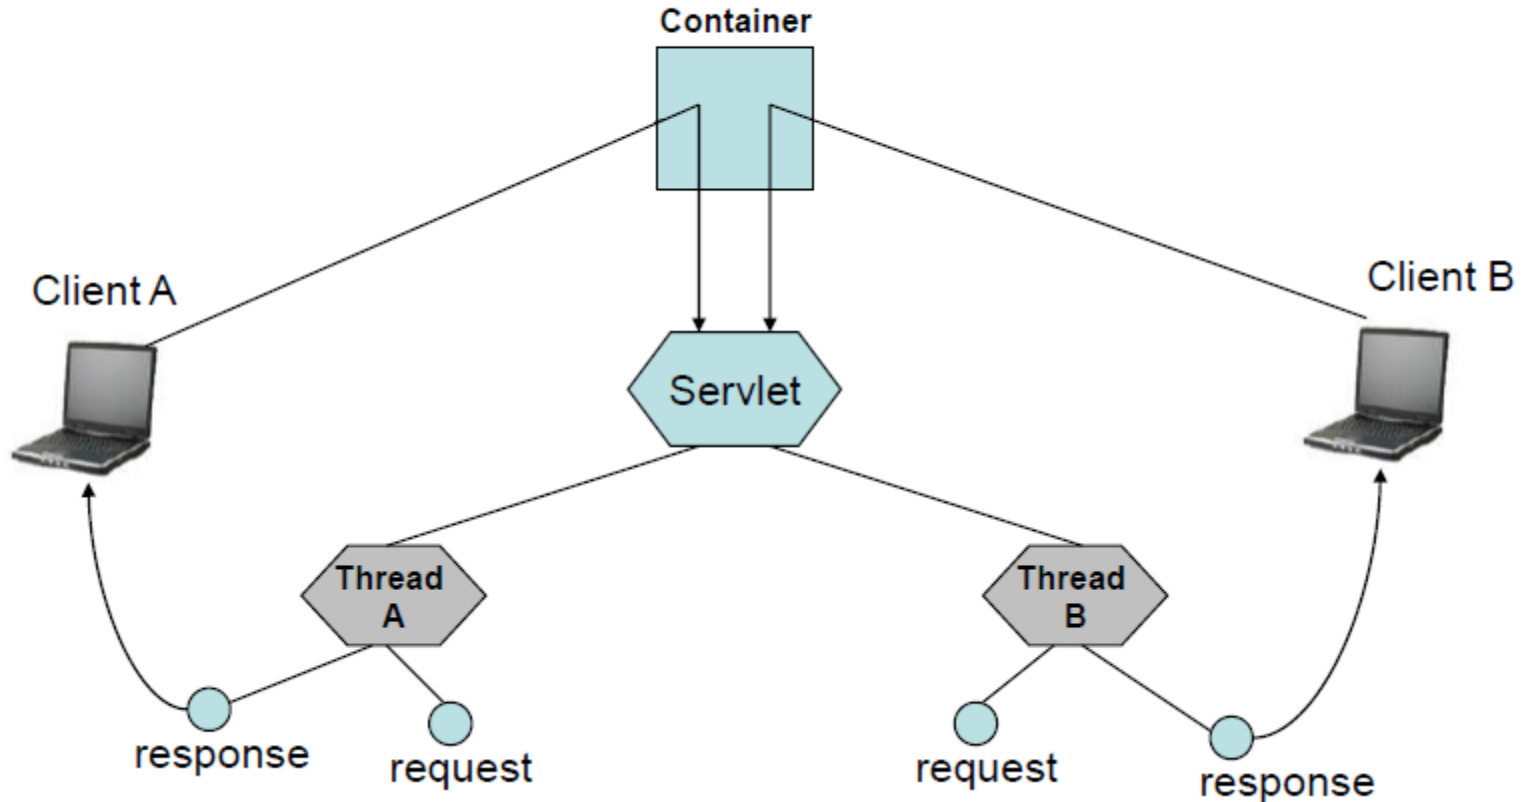

Servlet Life Cycle – 3 Big Moments

	When is it called	What it's for	Do you override it
<code>init()</code>	The container calls the <code>init()</code> before the servlet can service any client requests.	To initialize your servlet before handling any client requests.	Possibly
<code>service()</code>	When a new request for that servlet comes in.	To determine which HTTP method should be called.	No. Very unlikely
<code>doGet()</code> or <code>doPost()</code>	The <code>service()</code> method invokes it based on the HTTP method from the request.	To handle the business logic.	Always

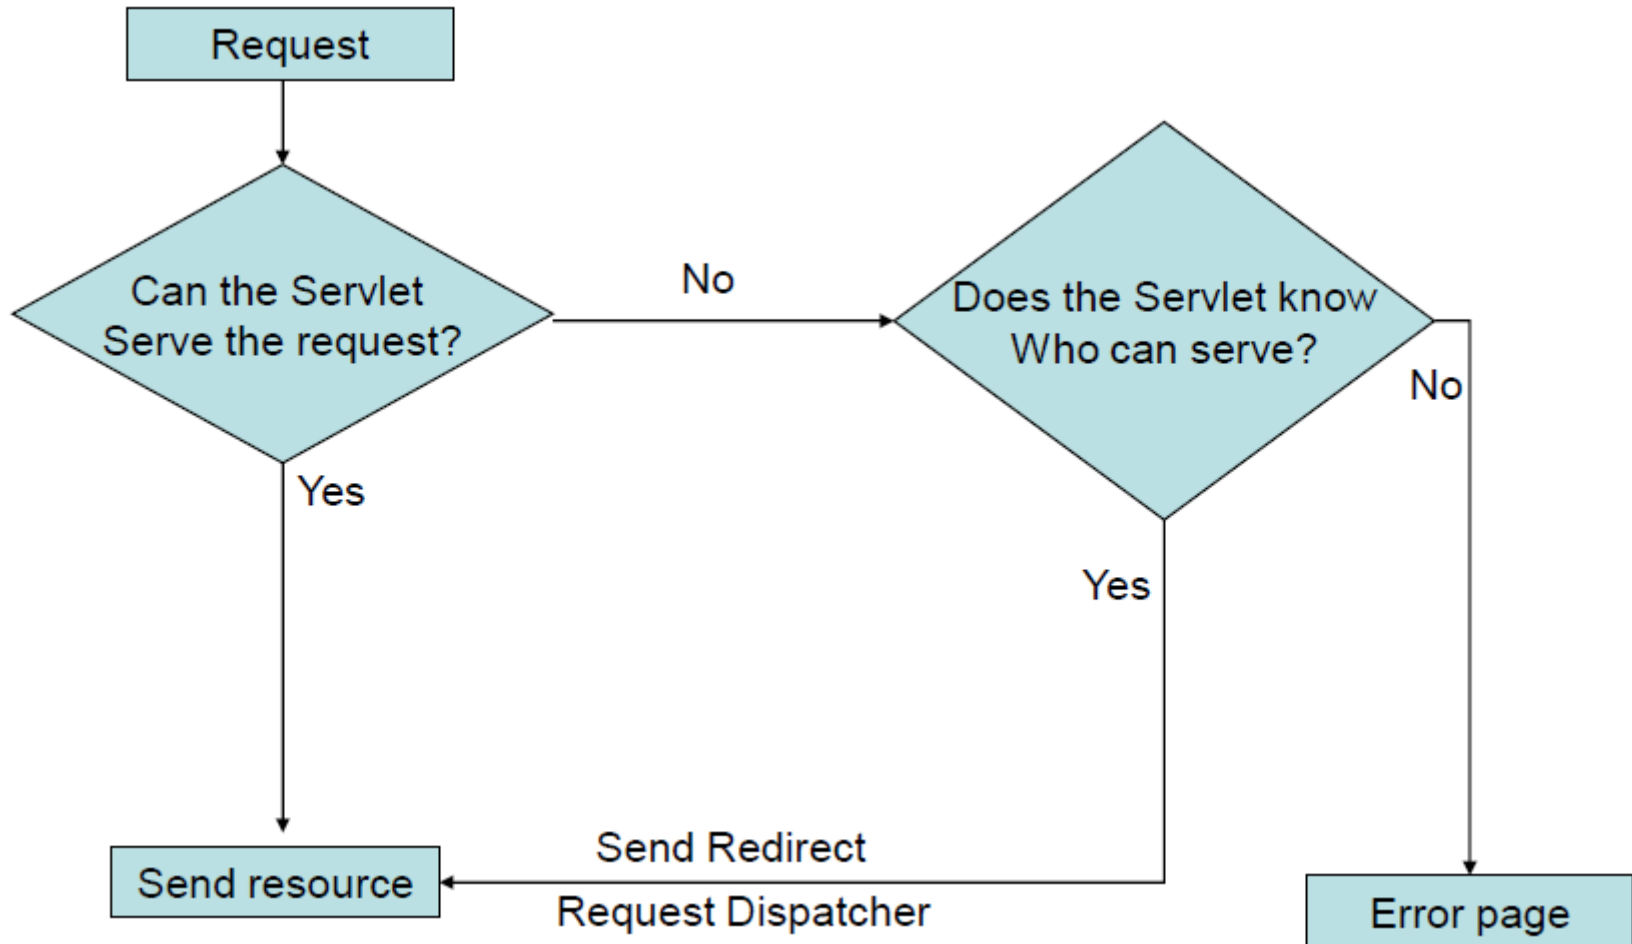

Servlet Request Thread Model

The Container runs multiple threads to process multiple requests to a single servlet.

Servlet Request-Response Flow

Deployment Descriptor

How does the Container know which Servlet the client has requested for?

web.xml

```
<web-app>
.....
<servlet>
  <servlet-name>LoginServlet</servlet-name>
  <servlet-class>LoginServlet</servlet-class>
</servlet>

<servlet-mapping>
  <servlet-name>LoginServlet</servlet-name>
  <url-pattern>/LoginServlet</url-pattern>
</servlet-mapping>
.....
.....
</web-app>
```
